Annex 1: Statistical tables

1.1	Operations evaluated, by years of approval and closing, 1995 cohort	4
1.2	Distribution of evaluated operations, by years of approval and closing, 1974–95	5
1.3	1995 cohort (264 projects newly evaluated in 1995), by region, country, and sector	6
1.4	Audited projects (n=92) in 1995 evaluation year, by region, country, and sector	14
1.5	Distribution of evaluated operations, by sector, lending type and source, region, and income group, 1995 cohort, 1990–94 and 1974–94 closing years	18
1.6	Disbursements of evaluated operations, by sector, lending type and source, region, and income group, 1995 cohort, 1990–94 and 1974–94 closing years	19
1.7	Cost variations and outcome, by sector and region, 1995 cohort	20
1.8	Implementation time variations and outcome, by sector and region, 1995 cohort	21
1.9	Comparison of performance outcome between large and small projects, by region, income group, and lending type and source, 1995 cohort, 1990–94 and 1974–94 closing years	22
1.10	Comparison between the top 10 largest satisfactory projects and the top 10 largest unsatisfactory projects, by amount of real disbursements, 1995 and 1994 cohorts	24
1.11	Outcome—relevance, efficacy, and efficiency, 1995 cohort	25
1.12	Sustainability of evaluated operations, by sector, major subsector, and lending type and source, 1995 cohort and 1990–94 closing years	26
1.13	Sustainability of evaluated operations, weighted by disbursements, by sector, major subsector, and lending type and source, 1995 cohort and 1990–94 closing years	27
1.14	Sustainability of evaluated operations, by region and income group, 1995 cohort and 1990–94 closing years	28
1.15	Sustainability of evaluated operations, weighted by disbursements, by region and income group, 1995 cohort and 1990–94 closing years	29
1.16	Percentage distribution of selected performance characteristics by performance level groups, 1995 cohort	30
1.17	Institutional development impact, by sector, major subsector, and lending type and source, 1995 cohort and 1990–94 closing years	31
1.18	Institutional development impact, weighted by disbursements, by sector, major subsector, and lending type and source, 1995 cohort and 1990–94 closing years	32
1.19	Institutional development impact, by region and income group, 1995 cohort and 1990–94 closing years	33

1.20	Institutional development impact, weighted by disbursements, by region and income group, 1995 cohort and 1990–94 closing years	34
1.21	Trends of project sustainability and institutional development impact, 1987–94 closing years	34
1.22	Bank and borrower performance, by region	35
1.23	Bank and borrower performance, by sector and region, 1995 cohort	36
1.24	Bank and borrower performance, by sector and region, 1988–94 closing years	37
1.25	Bank and borrower performance, weighted by disbursements, by region, 1995 cohort and 1988–94 closing years	38
1.26	Bank and borrower performance, weighted by real disbursements, by sector and region, 1995 cohort	39
1.27	Bank and borrower performance, weighted by real disbursements, by sector and region, 1988–94 closing years	40
1.28	Number of operations evaluated and percentage of satisfactory outcomes, by sector, major subsector, and lending type and source, 1995 cohort, 1990–94 and 1974–94 closing years	41
1.29	Performance outcomes, weighted by disbursements, by sector, major subsector, and lending type and source, 1995 cohort, 1990–94 and 1974–94 closing years	42
1.30	Outcome of evaluated operations, by region and income group, 1995 cohort, 1990–94 and 1974–94 closing years	43
1.31	Outcome of evaluated operations, weighted by disbursements, by region and income group, 1995 cohort, 1990–94 and 1974–94 closing years	44
1.32	Percentage of evaluated operations with satisfactory outcomes, by selected sectors, 1974–94 closing years	44
1.33	Percentage of evaluated operations with satisfactory outcomes, by selected sectors, closing years 1984–94 (two-year interval) and 1995 cohort	45
1.34	Percentage of evaluated operations with satisfactory outcomes, weighted by disbursements, by selected sector, 1974–94 closing years	46
1.35	Country portfolio performance, by region and country, 1995 cohort and 1990–94 closing years	47
1.36	Country portfolio performance, by income group and country, 1995 cohort and 1990–94 closing years	49
1.37	Country portfolio performance, weighted by disbursements, by income group and country, 1995 cohort and 1990–94 closing years	51
1.38	Country portfolio performance, weighted by real disbursements, by region and country, 1995 cohort and 1990–94 closing years	53
1.39	Rankings of selected countries (n=67), by country economic performance index, 1979–92	55
1.40	Rankings of selected countries (n=67), by portfolio performance, 1991–95	56
1.41	Risk and reward, by region and sector	57
1.42	Outcome performance trends of operations, by evaluation year, approval year, closing year, and ARPP fiscal year	58
1.43	Demandingness, 1979–91 approval years	59
1.44	Complexity, 1979–91 approval years	59
1.45	Riskiness, 1979–91 approval years	60
1.46	Demandingness, by Annual Review sector, 1979–91 approval years	60
1.47	Demandingness, complexity, and riskiness of projects objectives, 1995 cohort	61

1.48	Recent trends in demandingness, complexity, and riskiness of project objectives, 1990–94 closing years	61
1.49	Percentage of evaluated operations with satisfactory outcomes, by region, 1974–94 closing years	62
1.50	Percentage of evaluated operations with satisfactory outcomes, by lending type, 1974–94 closing years	62
1.51	Percentage of evaluated operations with satisfactory outcomes, by lending source, 1974–94 closing years	63
1.52	Performance of repeater programs, by region and sector, 1974–95 evaluation years	64
1.53	Percentage of projects rated likely sustainable, by region, 1987–94 closing years	65
1.54	Percentage of projects rated likely sustainable, weighted by real disbursements, by region, 1987–94 closing years	65
1.55	Percentage of projects rated likely sustainable, by mega sector, 1987–94 closing years	65
1.56	Percentage of projects rated likely sustainable, weighted by real disbursements, by mega sector, 1987–94 closing years	65
1.57	Percentage of projects with substantial institutional development impact, by region, 1987–94 closing years	66
1.58	Percentage of projects with substantial institutional development impact, weighted by real disbursements, by region, 1987–94 closing years	66
1.59	Percentage of projects with substantial institutional development impact, by mega sector, 1987–94 closing years	66
1.60	Percentage of projects with substantial institutional development impact, weighted by real disbursements, by mega sector, 1987–94 closing years	66
1.61	Percentage of projects with re-estimated economic rates of return, by region and sector, 1974–95 cohorts	67
1.62	Percentage of projects with re-estimated economic rates of return, by region, 1974–94 closing years	68
1.63	Average economic rates of return, by sector, region, and lending source, 1995 cohort, 1990–94 and 1974–94 closing years	69
1.64	Performance of operations, by levels of re-estimated economic rates of return, 1995 cohort	70
1.65	Performance of operations, by levels of re-estimated economic rates of return, 1990–94 closing years	70
1.66	Performance of operations, by levels of re-estimated economic rates of return, 1974–94 closing years	70
1.67	Low-yielding satisfactory and high-yielding unsatisfactory projects, by sector and region, 1995 cohort, 1990–94 and 1974–94 closing years	71
1.68	Variance of re-estimated economic rates of return, by approval year	72
1.69	Percentage of evaluated operations with satisfactory outcomes, by lending instrument, 1995 cohort, 1990–94 and 1974–94 closing years	73
1.70	Recent trends in regional Bank performance, by component, 1988–94 closing years	74
1.71	Comparison of projects with substantial physical achievements compared with Bankwide average, 1995 cohort	75

ANNEX TABLE 1.1: OPERATIONS EVALUATED, BY YEARS OF APPROVAL AND CLOSING, 1995 COHORT

1999	0	1
Total	264	264

a. The formal closing date normally occurs shortly after the final disbursement of the loan or credit. However, there are cases of projects where disbursements are either canceled or disbursed early where legally established closing dates are not adjusted. This explains the 10 evaluated projects with closing dates after 1995.

ANNEX TABLE 1.2: DISTRIBUTION OF EVALUATED OPERATIONS, BY YEARS OF APPROVAL AND CLOSING, 1974-95

Notes: Report type: PCR means project completion report; PAR is performance audit report; and EVM stands for evaluative memorandum. Outcome rating: 1 stands for satisfactory or highly satisfactory; 0 stands for unsatisfactory or highly unsatisfactory. Sustainability rating: LIK stands for likely; UNC stands for uncertain; UNL stands for unlikely; and NRAT stands for not rated. Institutional development impact rating: SUB stands for substantial; MOD stands for moderate; NEG stands for negligible; and n.a. stands for not available. The formal closing date normally occurs shortly after the final disbursement of the loan or credit. However, there are cases of projects where disbursements are either canceled or disbursed early where legally established closing dates are not adjusted. This explains the 10 evaluated projects with closing dates after 1995

ANNEX TABLE 1.4: AUDITED PROJECTS (N=92) IN 1995 EVALUATION YEAR, BY REGION, COUNTRY, AND SECTOR

a. There are some non-adjustment operations classified as program and policy. This explains why the amount of disbursements under program and policy is more than the amount of disbursements under adjustment.

Note: Totals may not sum, due to rounding error.

ANNEX TABLE 1.7: COST VARIATIONS AND OUTCOME, BY SECTOR AND REGION, 1995 COHORT^a

ANNEX TABLE 1.14: SUSTAINABILITY OF EVALUATED OPERATIONS, BY REGION AND INCOME GROUP, 1995 COHORT AND 1990-94 CLOSING YEARS

Country group	1995 cohort				1990-94 closing years			
	No.	% likely	% uncertain	% unlikely	No.	% likely	% uncertain	% unlikely
Region								
Africa	82	23	39	38	327	30	40	30
East Asia and Pacific	51	78	14	8	195	74	18	8
Europe and Central Asia	13	46	23	31	46	52	30	17
Latin America and Caribbean	50	46	40	14	161	53	32	15
Middle East and North Africa	25	40	40	20	96	51	35	14
South Asia	38	55	32	13	126	45	44	11
Country by income group ^a								
Lower (GNP per capita: \$695 or less)	137	39	36	26	499	38	40	22
Lower (without China)	125	44	46	35	457	34	42	24
Lower (without China and India)	104	30	38	33	405	33	42	26
Lower middle (GNP per capita: \$696-\$2,785)	73	53	27	19	267	56	27	16
Upper middle (GNP per capita: \$2,786-\$8,625)	40	63	25	13	148	69	23	8
Total/average	259	46	32	22	951	48	34	18

a. The classification of country income group was based on the *World Development Report 1995* (p. 249). It should be noted that though some countries have changed income groups, the latest classification is considered the most relevant. It reflects the dynamics in the past that have led to today's income levels, which are a good proxy for overall country environment.

a. The classification of country income group was based on the *World Development Report 1995* (p. 249). It should be noted that though some countries have changed income groups, the latest classification is considered the most relevant. It reflects the dynamics in the past that have led to today's income levels, which are a good proxy for overall country environment.

ANNEX TABLE 1.15: SUSTAINABILITY OF EVALUATED OPERATIONS, WEIGHTED BY DISBURSEMENTS, BY REGION AND INCOME GROUP, 1995 COHORT AND 1990-94 CLOSING YEARS

Country group	1995 cohort			1990-94 closing years		
	1994 \$ mill.	% likely	% uncertain	1994 \$ mill.	% likely	% unlikely
<i>Region</i>						
Africa	3,493	27	49	13,391	30	31
East Asia and Pacific	4,850	84	13	18,804	81	6
Europe and Central Asia	1,762	44	23	6,341	46	28

South Asia	5,600	65	25	14,299	57	10
<i>Country by income group^a</i>						
Lower (GNP per capita: \$695 or less)	11,191	54	35	34,378	51	16
Lower (without China)	7,884	52	35	28,829	45	19
Lower (without China and India)	4,274	33	44	18,697	35	25
Lower middle (GNP per capita: \$696-\$2,785)	7,384	59	24	22,653	61	18
Upper middle (GNP per capita: \$2,786-\$8,625)	6,471	61	29	23,547	73	8
Total	25,523	56	31	81,770	60	14

a. The classification of country income group was based on the *World Development Report 1995* (p. 249). It should be noted that though some countries have changed income groups, the latest classification is considered the most relevant. It reflects the dynamics in the past that have led to today's income levels, which are a good proxy for overall country environment.

ANNEX TABLE 1.16: PERCENTAGE DISTRIBUTION OF SELECTED PERFORMANCE CHARACTERISTICS BY PERFORMANCE LEVEL GROUPS, 1995 COHORT

Performance characteristics		High (n=10)	Upper medium (n=141)	Lower medium (n=116)	Low (n=25)	Poor (n=7)	All projects (n=264)
Process characteristics							
Satisfactory quality of Bank appraisal		100	86	54	46	29	71
Satisfactory quality at entry		100	83	47	38	29	67
Satisfactory quality of borrower's implementation		90	89	39	13	0	65
Satisfactory quality of Bank supervision		100	89	57	41	17	74
Full or substantial covenant compliance		100	82	38	29	57	64
Outcome characteristics							
High or substantial relevance		100	83	50	32	29	69
High or substantial efficacy		100	62	15	0	0	44
High or substantial efficiency		100	53	9	0	0	37
Sustainability characteristics							
Positive government commitment		90	89	44	12	0	71
Positive policy environment		70	84	31	7	0	63
Positive institution/management effectiveness		90	86	39	0	0	68
Positive economic viability		100	94	61	40	0	83
Positive technical viability		100	96	82	50	50	91
Positive financial viability		100	72	28	14	0	65
Positive environmental viability		33	100	75	67	0	86
Positive social impact/local participation		0	83	33	0	0	63
Characteristics of institutional development							
Positive borrower commitment		100	74	23	5	0	55
Positive quality of preparation		100	60	29	32	0	49
Positive design		88	75	32	31	25	57
Positive supervision		100	89	41	15	0	69
Positive establishment of a new organization		100	89	35	0	0	69
Positive elimination of an existing organization		0	80	20	0	0	65
Positive restructuring/privatizing/strengthening of an organization		100	77	64	43	100	73
Positive regulatory changes		100	87	87	0	0	89
Number and/or complexity of financing arrangements		0	45	0	0	0	39
Positive monitoring and evaluation		100	45	27	0	0	47
Notes: High performing group: outcome=highly satisfactory; sustainability=likely; institutional development=high or substantial. Upper medium performing group: outcome=satisfactory; sustainability=likely or uncertain; institutional development=substantial or modest. Lower medium performing group: outcome=satisfactory or unsatisfactory; sustainability=unlikely or uncertain; institutional development=negligible or modest. Low performing group: outcome=unsatisfactory; sustainability=unlikely; institutional development=negligible. Poor performing group: outcome=highly unsatisfactory; sustainability=unlikely; institutional development=negligible.							

Notes: High performing group: outcome=highly satisfactory; sustainability=likely; institutional development=high or substantial. Upper medium performing group: outcome=satisfactory; sustainability=likely or uncertain; institutional development=substantial or modest. Lower medium performing group: outcome=satisfactory or unsatisfactory; sustainability=unlikely or uncertain; institutional development=negligible or modest. Low performing group: outcome=unsatisfactory; sustainability=unlikely; institutional development=negligible. Poor performing group: outcome=highly unsatisfactory; sustainability=unlikely; institutional development=negligible.

Total/average	260	27	48	25	942	33	46	22

a. The classification of country income group was based on the *World Development Report* 1995 (p. 249). It should be noted that though some countries have changed income groups, the latest classification is considered the most relevant. It reflects the dynamics in the past that have led to today's income levels, which are a good proxy for overall country environment.

IBRD only	144	74	501	73	2,126	75
Total/average	264	68	965	69	3,813	72

a. SECALs include each sector's SECAL and multisector's SECALs.

b. Urban sector includes tourism and pollution control and solid waste as subsectors. Percentage calculations for sectors or subsectors with small number of projects should be treated with caution. There are some non-adjustment operations classified as program and policy. This explains why the number of operations under program and policy is more than the number of operations under adjustment.

ANNEX TABLE 1.29: PERFORMANCE OUTCOMES, WEIGHTED BY DISBURSEMENTS, BY SECTOR, MAJOR SUBSECTOR, AND LENDING TYPE AND SOURCE, 1995 COHORT, 1990-94 AND 1974-94 CLOSING YEARS

IBRD only	19,188	74	60,412	75	188,316	75
Total/average	25,613	73	81,944	74	260,971	74

a. SECALs include each sector's SECAL and multisector's SECALs.

b. Urban sector includes tourism and pollution control and solid waste as subsectors. There are some non-adjustment operations classified as program and policy. This explains why the amount of disbursements under program and policy is more than the amount of disbursements under adjustment.

ANNEX TABLE 1.30: OUTCOME OF EVALUATED OPERATIONS, BY REGION AND INCOME GROUP, 1995 COHORT, 1974-94 AND 1990-94 CLOSING YEARS

Country group	Satisfactory outcome					
	1995 cohort		1990-94 closing years		1974-94 closing years	
	Number of projects	% sat.	Number of projects	% sat.	Number of projects	% sat.
<i>Region</i>						
Africa	82	49	328	56	1,205	62
East Asia and Pacific	51	94	195	86	657	83
Europe and Central Asia	14	57	52	72	294	79
Latin America and Caribbean	53	69	165	66	768	68
Middle East and North Africa	26	72	97	72	395	79
South Asia	38	76	128	75	494	77
<i>Country by income group^a</i>						
Lower (GNP per capita: \$695 or less)	138	65	501	66	1,729	67
Lower (without China)	126	62	459	63	1,678	67
Lower (without China and India)	105	60	407	61	1,474	65
Lower middle (GNP per capita: \$696-\$2,785)	74	73	274	71	1,277	74
Upper middle (GNP per capita: \$2,786-\$8,625)	42	71	150	75	569	75
Total/average	264	68	965	69	3,813	72

a. The classification of country income group was based on the *World Development Report 1995* (p. 249). It should be noted that though some countries have changed income groups, the latest classification is considered the most relevant. It reflects the dynamics in the past that have led to today's income levels, which are a good proxy for overall country environment.

Country group	1995 cohort		Satisfactory outcome	
	1994 \$ mill.	% sat.	1990-94 closing years	1974-94 closing years
			1994 \$ mill.	% sat.
<i>Region</i>				
Africa	3,493	54	13,476	60

ANNEX TABLE 1.39: RANKINGS OF SELECTED COUNTRIES (N=67), BY COUNTRY ECONOMIC PERFORMANCE INDEX, 1979-92

Good (top 22 countries)	Country economic performance index	Median (middle 22 countries)	Country economic performance index	Poor (bottom 23 countries)	Country economic performance index
Korea, Republic	4.95	Côte d'Ivoire	3.32	Honduras	2.78
Mauritius	4.39	Burundi	3.25	Nigeria	2.76
Thailand	4.13	Togo	3.24	Romania	2.76
Malaysia	4.10	Morocco	3.22	Niger	2.76
China	4.07	Brazil	3.21	Argentina	2.75
Tunisia	4.01	Sri Lanka	3.19	Nepal	2.73
Jordan	3.99	Algeria	3.19	Yemen, PDR	2.71
Uruguay	3.89	Yemen Arab Republic	3.16	Burkina Faso	2.66
Chile	3.89	Paraguay	3.14	Mauritania	2.66
Indonesia	3.82	Jamaica	3.12	Guinea	2.61
Colombia	3.81	Zimbabwe	3.08	Egypt	2.59
Portugal	3.65	Pakistan	3.07	Benin	2.50
Malawi	3.63	Panama	3.06	Zambia	2.49
India	3.61	Philippines	3.05	Uganda	2.46
Hungary	3.60	Senegal	3.04	Central African Republic	2.41
Ghana	3.55	Papua New Guinea	3.04	Haiti	2.39
Turkey	3.49	Ecuador	3.01	Peru	2.38
Kenya	3.48	Madagascar	2.99	Ethiopia	2.36
Mexico	3.47	Bangladesh	2.91	Dominican Republic	2.16
Yugoslavia	3.45	Guinea-Bissau	2.89	Myanmar	2.09
Rwanda	3.39	Mali	2.86	Somalia	1.98
Cameroon	3.34	Tanzania	2.83	Sudan	1.85
				Zaire	1.69

Note: The country economic performance index is the average country performance rating prepared by the Bank for each country for the period 1979-92.

ANNEX TABLE 1.40: RANKINGS OF SELECTED COUNTRIES (N=67), BY PORTFOLIO PERFORMANCE, 1991-95

Good (top 22 countries)	Portfolio performance	Median (middle 22 countries)	Portfolio performance	Poor (bottom 23 countries)	Portfolio performance
Zimbabwe	1.00	Ethiopia	0.78	Panama	0.53
Hungary	0.98	Portugal	0.77	Sudan	0.50
Benin	0.97	Honduras	0.76	Nigeria	0.50
Thailand	0.97	Peru	0.75	Guinea	0.49
Uruguay	0.95	Pakistan	0.75	Mauritania	0.48
China	0.95	Jordan	0.74	Papua New Guinea	0.47
Malaysia	0.92	Yugoslavia	0.73	Kenya	0.46
Mauritius	0.91	Colombia	0.71	Sri Lanka	0.45
Mexico	0.90	India	0.69	Rwanda	0.43
Nepal	0.89	Tanzania	0.68	Argentina	0.41
Philippines	0.89	Yemen Arab Republic	0.67	Brazil	0.38
Jamaica	0.86	Bangladesh	0.64	Turkey	0.38
Indonesia	0.86	Senegal	0.62	Togo	0.38
Egypt	0.85	Zambia	0.62	Paraguay	0.37
Morocco	0.84	Burundi	0.61	Somalia	0.35
Chile	0.84	Ecuador	0.61	Dominican Republic	0.30
Korea, Republic	0.83	Madagascar	0.60	Niger	0.28
Yemen, PDR	0.82	Romania	0.60	Algeria	0.27
Côte d'Ivoire	0.82	Burkina Faso	0.58	Central African Republic	0.24
Ghana	0.81	Mali	0.57	Haiti	0.23
Tunisia	0.81	Myanmar	0.54	Uganda	0.19
Malawi	0.79	Guinea-Bissau	0.54	Cameroon	0.19
				Zaire	0.10

Note: The portfolio performance index is the average rating of the portfolio performance rating of projects evaluated during 1991-95 and approved after 1979.

ANNEX TABLE 1.41: RISK AND REWARD, BY REGION AND SECTOR

Annex 2: Methodology for assessing portfolio risk and management options

Chapter 3 adopts a conditional probability approach to measure the likelihood of satisfactory outcome for active projects not yet completed. The approach is based on the known relationship between outcome and a set of conditioning factors for recently evaluated projects. This relationship is measured by a set of probabilities, each derived from the outcome ratings of evaluated projects for a given combination of the risk factors.

The risk factors

In order to apply a forecast to active projects, observable risk factors for these projects are needed. This precludes the use of historical, OED-generated variables as used in the econometric analyses. Instead, observed factors from the active portfolio are needed. The following three factors are used, based on their relation to performance determinants confirmed by OED as important and on their availability for active projects: risk status as determined by the Quality Assurance Group (QAG), age, and country performance as measured by the resource mobilization and development economics departments (FRM/DEC).

The model uses the "*projects at risk*" measure reported by the QAG in the context of the ongoing Portfolio Improvement Program (PIP). The QAG labels individual projects as either at actual risk, potential risk, or low risk based among other things on implementation ratings (as described in Chapter 3 of Volume I). This data is available back through the FY86 active portfolio.

The age of the active project is also controlled for. This is important due to the natural progression of implementation ratings as documented by the Annual Report on Portfolio Performance (ARPP). Three age groups are defined: "young" projects are those at the most three years from approval; "mature" projects are four to six years old; and "old" projects are those active more than six years after approval.

The *country environment* plays a critical role in determining project performance. Consistent with the cross-country econometric analysis presented in Chapter 3, the Bank's country performance ratings (from FRM/DEC) are used in the conditional probability model. These ratings, available since 1977, focus on an individual country's short- and long-term economic management and poverty alleviation efforts. The ratings range from 1 (worst) to 5 (best). Country ratings have been translated into project-specific indexes by taking an average of the country ratings over the six-year period from two years prior to board approval until three years after board approval. Project indexes fall into three categories: lower performance (index less than or equal to 2.95), middle performance (index greater than 2.95 but less than 3.4), and upper performance (greater than or

equal to 3.4). These thresholds yield a breakdown of the portfolio into three groups with roughly the same number of projects.

Deriving and applying the conditional probabilities: the status quo stock forecast

The probabilities derived from recently evaluated projects represent the likelihood of expected satisfactory outcome for active projects with the same risk factors. For example, consider a four-year old active project in the lower country performance group that QAG currently classifies as at "potential risk." The project's probability of success is derived from a weighted average of recently evaluated projects with the same risk factors. Applying the complete set of these conditional probabilities across the stock of projects active in FY96, comprising 1,752 projects as defined in the FY96 ARPP, yields a "status quo" stock forecast of 68 percent satisfactory for the entire portfolio irrespective of project closing years. In this way, a baseline estimate of portfolio performance is provided, against which one can measure the effects of the important changes in portfolio management currently under way in the Bank.

A flow forecast of the impact of management actions

The sample used in the stock status quo forecast will age and exit the active portfolio over the coming years. Based on estimated closing dates, the active portfolio will be completely renewed by FY2004. A flow analysis was undertaken to show the continued effect of the churning of entry/exit into the future, under the assumption that several management options would be executed. Starting with the portfolio active in FY96, projects are grouped according to their expected closing year. Approval cohorts of 250 projects per year are continually added (with a country, risk, and project life distribution consistent with the FY96 approvals) until the active portfolio is completely turned over and replaced by new projects. The conditional probability model is applied to these cohorts with two main differences over the stock status quo forecast—projects are explicitly aged and management options are modeled.

The historical data show that in general as projects age, their risk status deteriorates. In the flow analysis, a project active in FY96 that is expected to exit the portfolio in FY99 is similarly aged, with the transitional probabilities based on QAG risk status data for the FY91 to FY96 portfolios. The progression of projects through time with respect to their risk status uses a weighted average of the QAG data, with greater emphasis given to the more recent data. In addition, the weights "evolve" in the future in that the behavior of a project expected to exit in FY2000 is shaped by a weighted average of the FY92 to FY96 probabilities. This "rolling" weighting scheme assumes there is learning and adaptation. The weighting scheme is similarly applied to the conditional probabilities for projects in the outer years.

Regarding the management actions modeled in the "simulated" forecast, the analysis assumes that management cancels and restructures some of those projects identified with the highest risk. The analysis also assumes that the number of projects at risk is reduced, an explicit goal of the PIR. Last, a significant improvement in the quality at entry is modeled.

Management is assumed to *cancel and restructure* projects based on their risk status and age. Projects that are young and already perceived to be at actual risk

receive full management attention. Half are assumed canceled and automatically given an unsatisfactory outcome rating, while the other half are restructured and re-enter the portfolio classified in a similar way to new projects in the lowest risk group. The analysis applies a similar treatment to the mature projects at actual risk, with one-quarter canceled and one-quarter restructured.

A *reduction of projects at risk* is assumed. The PIP originally focused on reducing the number of projects at risk by 8 percentage points by the end of FY97. Due to the longer time period of the flow forecast, it is assumed there is a reduction of the projects at risk by 20 percent. This goal is phased in since projects nearly completed leave little room for this marked improvement.

The analysis assumes that newly approved projects have *better quality at entry and selectivity* than their predecessors. They all enter the portfolio in the lowest risk group, with the representation in terms of number of projects of the 25 countries on the current QAG watchlist cut in half. More importantly, they are assumed to fare more favorably than their predecessors, with a gradual improvement to virtually no deterioration from the initial classification of low risk for approvals after FY99. That is, after FY99 new projects stay in the low-risk group throughout their life as a reflection of their superior quality at entry.

With all of the above factors at work, the result of the flow analysis is an improvement in the portfolio to an 80 percent satisfactory mark by FY2004. This is when the exit cohort is comprised of all new projects.

Annex 3: Methodology for assessing performance at project completion

Introduction

This twenty-second Annual Review of Evaluation Results analyzes the performance of the World Bank's 1995 cohort of projects. The methodology for the ratings on which it bases its analyses are the subject of this annex. The annex describes the Bank's rigorous system for rating projects at the end of implementation. The system is based on self-evaluation by the Bank's regions and independent evaluation by its Operations Evaluation Department (OED). The annex focuses on the regions' implementation completion reports (ICRs) as the vehicle for rating projects and on OED's role in that system. It presents and discusses the criteria that OED uses to review results-oriented project outcome, sustainability, and institutional development impact ratings, and the process-oriented Bank and borrower performance ratings. It also includes responses to frequently asked questions concerning the rating system.

Rating systems require resources and time from usually hard-pressed operations staff and/or evaluators. Why have them? There are three major reasons. The first is accountability for results. The reliable measurement of quality is a fundamental prerequisite of good management. Rating systems are a means of giving structure and reducing subjectivity so that reliability is achieved in judging the progress or success of an aid intervention. The second reason is to track the effectiveness of portfolio management. Portfolio management requires the weighing of development risks; rating systems can be used in aggregating projects by region, sector, or country to look at past records of success or failure. As seen in this and other documents, they can also be used as the basis for predicting future performance of ongoing projects. The third reason is to learn from experience. Organizational learning requires systematic analyses of what makes projects succeed or fail. Rating systems help bring attention to the lessons so that they can be incorporated into the design of new projects. OED's independent evaluation gives credibility to the self-evaluation process.

The process

As shown in Figure 3.1, implementation completion reports are embedded in a larger system of monitoring and evaluation of project performance.¹ As mentioned, evaluation within the Bank has two major dimensions: (1) self-evaluation by those responsible for particular programs and activities, that is, the regions and borrowers; and (2) independent evaluation by OED. The Bank's regional staff regularly monitor ongoing lending operations through loan supervision. Supervision reports are prepared regularly during the project execution stage. Guidelines for monitoring current operations have recently been enhanced in a new Form 590, which, among other changes, attempts to assess

project risks more explicitly. Generic issues from supervision reports feed into country portfolio performance reviews (CPPRs) and the Annual Report on Portfolio Performance (ARPP). When each operation is completed, regional staff prepare an ICR, often in conjunction with the last supervision mission (which takes place as the Bank is completing its disbursements for the operation). The ICR is produced within six months of the final disbursement.

These completion reports provide a crucial benchmark for OED's independent reviews. To ensure their integrity and to validate their performance ratings, OED reviews every completion report. In addition, OED historically has fielded audit missions in 40 percent of these cases for more in-depth review of results.² The audits use the same evaluation criteria that OED uses for rating the completion reports, and in more than 80 percent of the cases, the audits confirm the earlier OED ratings. When they differ, however, the audit ratings take precedence in the OED database for analytic purposes. Impact evaluations and evaluation studies of operational policies, country and sector programs, and portfolio management processes also form part of OED's work.

FY95 marked the first year of the transition to ICRs from the prior project completion reports (PCRs), as recommended by the Portfolio Management Task Force (PMTF) Report. The report, in a key process change designed to strengthen regional accountability, called for the regions to send the ICRs directly to the board of executive directors, without prior scrutiny by OED. Under new guidelines (OP/BP/GP 13.55), a streamlined presentation was introduced and regions were instructed to provide explicit self-evaluation ratings. Under the new procedure, the director general, Operations Evaluation, contin-

ANNEX FIGURE 3.1: EVALUATION AND THE POLICY CYCLE

ues to validate performance ratings for the institutional database and to oversee the preparation of evaluative memoranda that are addressed to the board and designed to provide an independent assessment of project performance. OED reviews now take place, however, only after the regions have sent the ICRs to the board. The evaluative memoranda comment on the performance ratings of the operation, the lessons to be drawn, whether the operation is a candidate for performance auditing, and the quality of the ICR. They are bundled and transmitted to the executive directors and the president halfway through the fiscal year and at the end of the fiscal year. A memorandum on each ICR is also sent to the country director from OED's director and presents and discusses the director general's evaluative memorandum.

In search of greater development impact "on the ground," the PMTF also called for a refocus of the completion reports on the project's transition to the operational phase and its sustainability. The new guidelines called for borrowers to provide a plan for the operational phase of the project, including performance indicators to monitor operations and development impact. While traditionally the focus has been on project outcome—the extent to which the project had achieved its major relevant objectives at the end of implementation—OED has reflected this change by placing more emphasis on the longer-term aspects of development effectiveness: sustainability and institutional development impact.

OED discussed its approach to assessing the PCRs in Annex I of the 1990 Annual Review of Evaluation Results. In that report OED emphasized that its *ex post* evaluation relied on a mix of quantitative and qualitative assessments. It stressed that the regional assessments presented in PCRs were made by experienced project officers, who had extensive knowledge of the development processes in the sector and country in which the project was implemented. In their role as project supervisors, these staff were inevitably required to make ongoing evaluations of project performance as it unfolded. The PCR was logically the final record of their evaluation, which was established progressively over time. OED further indicated that its judgments were made by experienced evaluation staff, all of whom had prior experience as project officers. However, the evaluation staff possessed the added perspective of reviewing many projects in a given year, independent of any previous involvement with the particular project being evaluated.

The same generally holds true for the ICR evaluation process. The methodology remains a mix of qualitative and quantitative assessments, made by experienced project officers and validated by experienced independent evaluation staff who review many project assessments in a given year. The assessments made by project officers and OED evaluation staff are much more than checklist exercises, although they are based on a set of defined procedures for rating the performance and results of Bank lending operations. OED essentially assesses project performance and results on six dimensions. Three of these—outcome, sustainability, and institutional development impact—focus on the results of the project and the likelihood that these results will continue. Another two of the dimensions focus on management of the process by the Bank and the borrower, that is, how good a job each partner has done during the different stages of the project cycle. The last dimension looks at the quality of the ICR itself. While this last dimension is not a part of this report's analyses, the annex describes it in order to present the complete ICR evaluation process.

Evaluating project performance and results

Regional staff assess project performance and results in terms of three interdependent criteria: *outcome*, *sustainability*, and *institutional development*. Briefly, review of an operation's *outcome* seeks to determine if the operation has achieved most of its major goals and has achieved, or is expected to achieve, satisfactory development results with only a few shortcomings. *Sustainability* is the probability, at the time of evaluation, of maintaining the achievements generated or expected to be generated in the operational plan. *Institutional development* is the extent to which a country's ability to make effective use of its human, organizational, and financial resources has improved. While the ICR's institutional development (ID) rating focuses on achievement of stated ID objectives, OED evaluators review the operation and the regions' ratings with a focus on the institutional development *impact* achieved, or expected to be achieved, as a result of the operation. Thus, these two ratings are not, at this point, strictly comparable.

Regional staff and OED evaluators also assess an operation's performance and results in terms of the role of the different factors at various phases of the project cycle, presented in Figure 3.1:

- *The Bank's performance* at the identification, preparation, appraisal, and supervision stages of the project cycle.
- *The borrower's performance*, evaluated in terms of the policy environment created for the project, the level of commitment of the government and of key institutions associated with the project, the provision and reliability of domestic funds for the operation, the administrative procedures, and the quality of decision-making.
- *The performance of implementing agencies*, rated on such elements as the quality of management and staff associated with the project; the use and effectiveness of technical assistance, including training, advisers, and contractual services; the adequacy of monitoring and evaluation systems; and the extent and quality of participation by intended beneficiaries, including their contribution to the project's outcome.

Exogenous factors are also recorded, such as changes in process and world market conditions, natural disasters, civil disorder and armed conflict, and actions of partners who are independent decision makers—for example, cofinanciers, non-governmental organizations, contractors, and suppliers. These factors often—at least in part—explain shortcomings in process management and results.

Criteria for rating project performance and results: outcome

As indicated, OED evaluators review the outcome of a completed operation from three related perspectives: *relevance*, *efficacy*, and *efficiency*. In reviewing *relevance*, evaluators determine whether the operation's goals were consistent with country and sector assistance strategies and whether the design was appropriate in terms of one or more of the Bank's goals of reducing poverty, protecting the environment, developing human resources, and fostering growth in the private sector. In examining *efficacy*, evaluators review the operation's effects and compare them with its goals, whether physical, financial, institutional, or policy related. With regard to *efficiency*, evaluators assess results in relation to inputs, looking at costs, implementation times, and economic and financial results (such as the economic and/or financial rate of return or a measure of cost-effectiveness).

As part of this assessment, OED evaluators consider the project's demandingness, complexity, and riskiness. Demandingness refers to the extent to which the project could be expected to strain the economic, institutional, and human resources of the government and/or implementing agencies. Complexity refers to such factors as the range of policy and institutional improvements contemplated, the number of institutions involved, the number of project components, and the number of cofinanciers. Riskiness refers to the likelihood that the project, as designed, would be expected to fail to meet relevant project objectives efficiently. Evaluators consider the extent to which the project could reasonably have been expected—at the time of project preparation and appraisal—to face known risk factors such as lack of borrower commitment, inadequate counterpart funding, or war or civil disorder.

If a project was formally restructured, OED usually reviews it in terms of the revised objectives. If no formal restructuring took place, the operation's outcome is reviewed not only in terms of the original objectives that provided the rationale for undertaking the operation (that is, the extent to which the operation has reached, or is expected to reach, the physical, economic, social, and institutional goals set at the time of its approval), but also in terms of the relevance of the original and revised objectives at project completion (that is, the extent to which they contribute to achievement of country and sector development priorities). The outcome rating also takes into account the developmental achievements expected from the operation in relation to the resources that have been, and will be, used over the life of the operation.

Where the project's objectives were not adequately specified, OED imputes them on the basis of records pertinent to the operation and through interviews with Bank staff. Where the objectives were revised during implementation, the timeliness of the revisions is considered.

Thus, arriving at a rating is both a retrospective and a forward-looking evaluation exercise as it implies a fresh assessment of the known costs and prospective outcomes of the operation, taking into account factual implementation evidence. This requires some exercise of judgment regarding the quality and relevance of project selection; the causes of success or failure for particular aspects of the operation; and the impact of factors internal to the operation or external to it.

OED bases its rating of project outcome on assessments of the following aspects of relevance, efficacy, and efficiency:

- relevance of the operation in terms of country and sector developmental priorities as perceived both at the time of project approval and at the time of evaluation;
- effects of macroeconomic and sector policy on the operation (for example, overvalued exchange rates, trade quotas, price controls, and so on);
- extent to which physical and other objectives have been (or are expected to be) met;
- actual and expected capital and recurrent costs of the operation, both direct and indirect, including social and environmental;
- economic, financial, social, environmental, and institutional benefits related to actual and expected achievements, both direct and indirect; and

ANNEX BOX 3.1: EXAMPLE OF AN UNSATISFACTORY PROJECT WITH MODERATE ACHIEVEMENT OF PHYSICAL/TECHNICAL OBJECTIVES

A project may receive an unsatisfactory outcome rating but still have some positive benefit in terms of achieving physical or technical objectives. A case in point from the 1995 cohort is the fourth Caribbean Development Bank (CDB) regional vocational and technical education project. The project, approved in 1987 for \$6 million, was the first IDA-assisted vocational and technical education project in Dominica, Grenada, St. Kitts and Nevis, St. Lucia, and St. Vincent and the Grenadines. The project aimed to improve the quality and supply of trained manpower in the technical and vocational areas by improving the quality of buildings and instruction, increasing the capacity of these Eastern Caribbean States to implement technical-vocational education projects, and enhancing management of the education sector.

The project expanded the technical and vocational education capacity in the participating countries. The fellowship program was completed, and a first comprehensive pre-vocational curriculum for lower (junior) secondary students was designed and integrated into the education systems. However, the project experienced serious implementation problems in the civil works and equipment and furniture components. The civil works component comprised 22 subprojects involving new construction, expansion, or renovation of existing facilities. All subprojects were completed despite some substantial delays, but 18 of the 22 subprojects had cost overruns ranging from 40 to 100 percent. The qualitative improvement of facilities and instruction were less than expected because of deficiencies in the equipment and furniture, causing non-optimum use of planned workshops and/or training centers. There was lack of coordination between civil works and procured furniture and equipment. The objective of enhanced sector management, which was related to the development of national and regional training boards, was only partially achieved. The institutional strengthening measures comprising improvement of the local education administrative structures and the adoption of cost saving and cost recovery measures to sustain the project were not achieved.

- the relation between the re-estimated economic rate of return (based on re-estimated benefits and costs) and the opportunity cost of the resources used.

Thus, satisfactory outcome means that the operation has achieved most of its major relevant goals and has achieved, or is expected to achieve, satisfactory results with only a few shortcomings. OED assigns one of six ratings on project outcome: highly satisfactory, satisfactory, marginally satisfactory, marginally unsatisfactory, unsatisfactory, or highly unsatisfactory. While OED assigns one of these six ratings to project outcome, the ICRs prepared by the regions use a four-point scale that does not contain the "marginal" ratings. OED has not moved to make its scale consistent as it believes the "shades of gray" distinctions are important. In analysis of rating statistics, and specifically for this review, OED "counts" a marginally satisfactory rating as a satisfactory rating, and a marginally unsatisfactory rating is reported as an unsatisfactory rating. OED uses the marginal ratings, however, in providing feedback to the regions.

An important point to note is that a project may receive an unsatisfactory outcome rating but still have some positive benefit. Annex Box 3.1 provides such an example.

As the following example in Annex Box 3.2 shows, OED review can result in a rating “upgrade” as well as a “downgrade” or rating “endorsement.” Annex Box 3.3 provides an example of a case where the OED marginal rating deviates from the regional rating and shows the rationale for OED’s rating.

Sustainability is the probability, at the time of evaluation, of maintaining the achievements generated at the time of implementation completion, or expected to be generated in the operational plan for the future. Arriving at a sustainability rating requires examining basic factors such as borrower commitment; policy environment; institution/management effectiveness; and economic, social, technical, financial, institutional, and environmental viability. It is distinct from the economic justification concept since it focuses on those features that contribute to the durability of the development operation, in relation to the project’s expected useful life and its likely resilience to external shocks and changing circumstances.

Although, there is some overlap between the criteria that enter into assessing sustainability and project outcome, OED does not automatically rate all projects sustainable that it rates satisfactory in outcome. Annex Box 3.4 shows how these ratings may differ. Judgments about outcome consider the costs and benefits of the initial investment and ask whether, in the light of experience, this project was worthwhile. Sustainability, on the other hand, starts from a different perspective in that the initial investment is now a sunk cost. The evaluator asks in effect: Given that the costs of the initial investment are behind us, is this project likely to generate a flow of benefits large enough to exceed the expected marginal costs of operation? If the answer is yes, the OED evaluator rates project sustainability as likely. For instance, projected oil prices may be insufficient to generate revenues exceeding full costs, taking the costs of the original investment into account; they may, nonetheless, be more than sufficient to cover the

Project: Tunisia Petroleum Exploration Promotion Project (L3023-TUN)

ICR rating: Highly unsatisfactory

OED rating: Satisfactory

OED rationale for its rating:

The project’s central objective was to attract private sector participation in hydrocarbon exploration activities and thereby to increase exploitation of Tunisia’s hydrocarbon resources. This primary objective was met. Two petroleum basins were studied and promoted to private companies. Promotion activities led to an expansion of exploration activity from 15 operators in 1989 active on 26 permits, to 26 operators in 1994 active on 40 permits. The national petroleum organization’s technical capabilities were strengthened, although it did not gain independence from direct control by government ministries. Government bidding procedures were cumbersome and after considerable delays, it was agreed that many of the loan components that were to be used for data acquisition and analysis were no longer necessary for project success. About 75 percent of the loan was eventually canceled.

OED rated the project’s outcome as satisfactory since the primary objective of attracting private investment for petroleum exploration was met. The ICR, in contrast, focused on the difficulties encountered in procuring goods and services that eventually were proven to be unnecessary to meet the project objectives.

ANNEX BOX 3.3: EXAMPLE OF A marginally SATISFACTORY OUTCOME RATING

Project: China: Fertilizer Rationalization Project (L2838-CHA)

ICR rating: Satisfactory

OED rating: Marginally satisfactory

OED's rationale for its rating:

Since the mid-1980s, the Bank has assisted the government of China in its efforts to expand and rehabilitate its existing fertilizer manufacturing capacity. This project, the second in a series of four projects, had as its objectives to (a) construct a urea plant in each of four existing nitrogenous fertilizer units; (b) construct a new DAP/NPK plant; and (c) improve institutional capacity by introducing modern financial and management systems and techniques.

Although all five plants were in commercial operation by the end of 1993, technical problems prevented most of the plants from achieving the designed input/output efficiencies, while other factors (such as the lack of electric power) limited their capacity utilization levels. The reimposition of fertilizer price controls in September 1994 (with deregulated input prices) jeopardized the financial health of all the units. Despite the satisfactory achievement of physical and environmental objectives, OED rated the outcome marginally satisfactory because, contrary to prior agreement, price controls were reimposed and the fertilizer units operated under a distorted price regime.

costs of regular operation. Thus, an unsatisfactory outcome may coexist with sustainability. In contrast, a project could have an uncertain or unlikely sustainability rating, but a satisfactory outcome rating. This could happen, for example, in a school construction project where the objectives of building the school and training of teachers are met, but where there has been little thought given to maintenance or payment of teachers' salaries in the future.

Key factors underlying OED's rating of sustainability are:

- economic, for example, the extent to which project achievements depend on appropriate macroeconomic policies being in place, and their likely continuity or improvement (for example, exchange rate policy or the budgetary situation), or the extent to which likely re-estimated net present values or cost effectiveness indicators are based on robust assumptions;
- external, the extent to which project achievements depend on exogenous factors such as terms of trade or the political situation in neighboring countries;
- financial, the extent to which the project can be expected to generate adequate revenues or to receive adequate budgetary funding in the future (considering the likely development of the country's fiscal situation);
- technical, the extent to which the project achievements rely on technological improvements—more efficient use of inputs, increases in outputs, resource flows, or productivity;
- social, the extent to which community participation and beneficiary incentives are deemed adequate to maintain the flow of project benefits, with spe-

ANNEX BOX 3.4: PROJECT WITH LIKELY SUSTAINABILITY BUT UNSATISFACTORY OUTCOME

Project: India: Indira Sarovar Hydroelectric Project (Loan 2416-IN, Credit 1613-IN, and Special Fund Credit SF 20-IN)

Sustainability rating: Likely

Outcome rating: Unsatisfactory

OED's rationale for its rating:

The project's original objectives were to (1) increase the generating capacity of the Madhya Pradesh Electricity Board (MPEB); (2) achieve a more efficient use of existing power stations; and (3) expand and modernize the MPEB's data processing facilities. The project was to construct the Indira Sarovar hydroelectric plant, execute a pilot program of thermal power plant rehabilitation at the MPEB, and expand and modernize MPEB data processing facilities. The project failed to substantially achieve any of its original objectives. The hydroelectric plant was canceled in light of concern with the environmental and resettlement impacts of the component. The restructured project ended six years later because of inadequate progress with MPEB's tariff policies. At the time the project was closed, the thermal plant rehabilitation component was about 40 percent complete and the upgrading of data processing facilities was about 60 percent complete. MPEB, however, continued implementing these components with its own resources.

Given the partial implementation of even the limited objectives of the restructured project, OED rated the project outcome unsatisfactory. As MPEB is continuing the implementation of the restructured project after project closing, OED regards the modest achievements of the project as likely to be sustainable.

cial emphasis on the extent to which reductions in poverty or improvements in conditions for women are likely to be durable;

- environmental, the extent to which the project affects the environment and/or renewable and nonrenewable resources;
- institutional, the extent to which institutional changes, at the level of the project entity and higher levels, are deemed sufficient to assure durable delivery of benefits by the project; and
- governance, the extent to which there is sufficient "ownership" by the government and project beneficiaries of project objectives, or the extent to which political stability will permit the flow of project achievements to be maintained.

To arrive at a rating, the evaluator weighs these factors and assesses whether a shortcoming in any of them is sufficient to jeopardize the ability of the project to deliver its expected achievements. If a factor is found to be constraining, the evaluator assesses the likelihood of relaxation over time. Sustainability ratings of likely, uncertain, or unlikely can be assigned. Annex Box 3.5 presents an example of an OED downgrading of an ICR on a sustainability rating.

ANNEX BOX 3.5: EXAMPLE OF A SUSTAINABILITY RATING DOWNGRADE

Project: Botswana Selebi-Phikwe Technical Assistance (L2695-BT)

ICR rating: Likely

OED rating: Uncertain

OED's rationale for the rating difference:

The loan's objectives were to diversify the economic base of the mining town of Selebi-Phikwe, strengthen local administration, and upgrade the housing policy planning and implementation capabilities of the government ministry.

OED rated sustainability as uncertain because the continuance of two major project components required actions on the part of the government that had not yet been spelled out at the time of the ICR mission. The unit managing the Regional Development Program had been transferred from one agency to another, which was itself being restructured and given autonomy to conduct its responsibilities. Such institutional restructuring usually takes time to work out. Moreover, in OED's view, the project's sustainability might have been better ensured had the project provided for local managers with expertise to replace the expatriate consultants who ran the industrial promotion component. The sustainability of a third component—the in-house training program—also depended on follow-up actions that were still being debated when the ICR mission met with the government. The likelihood of sustainability of this component would have been greater had the program placed more emphasis on the training of local trainers and of adequate counterpart staff to manage the program.

**Criteria for rating project performance and results:
institutional development impact**

Institutional development is the improving of a country's effective use of its human, organizational, and financial resources. Between 1989 and 1993, evaluators assessed ID efficacy, that is, a country's achievement of explicit, sometimes narrow, ID objectives. Because the ultimate test of the Bank's programs is their short- and long-term effects on people, policies, and domestic capacities, however, OED has recently been placing more emphasis on institutional development impact. Although a project may have few, or no, formal institutional development objectives, change or impact is the ultimate purpose of the loan. And, while Bank-financed operations do not always have explicit capacity-building objectives, they often depend on ID activities to ensure durable development impact. These may include strengthening, eliminating, or reforming existing institutions; improving the enabling environment, for example, through changes in legislation, or creating domestic capacities to implement appropriate policies and programs. Since 1994, evaluators have rated both ID efficacy (which is consistent with the 1989-93 achievement rating) and the ID impact of the project.³ Beginning with this Annual Review, OED reports institutional development impact as the most comprehensive measure of success or failure, instead of achievement of often narrowly defined explicit objectives. Thus, OED evaluators assess the ID impact achieved, or expected to be achieved, as a result of Bank-supported interventions.

The above definition of ID includes policy reform as a component, in that such reform contributes to a country's ability to use its resources effectively. It also

includes social development.⁴ In order to enhance the capacity for development initiatives, the Bank (a) encourages its borrowers to foster an enabling environment for the variety of institutions that can contribute to the development process; (b) finances capacity-building initiatives to increase institutional effectiveness and efficiency in these areas; (c) ensures that institutions in the initiatives it supports are appropriate to the task, and acceptable to the people involved; and (d) supports work to enhance the role of social capital in fostering economic and social development.⁵

OED evaluators examine the following key aspects to evaluate institutional development impact:

- relevance of the project's ID objectives;
- degree to which achievement of ID objectives has affected the legal, regulatory or policy environment, and macroeconomic or financial conditions;
- extent to which projects with regulatory or other policy change objectives have positively affected behavior—be it economic, social, environmental, or natural resource related;
- extent to which achievement of ID objectives has resulted in agency restructuring, elimination of an existing organization, or establishment of a new organization; and
- extent to which the achievement of ID objectives has led to sustainable increased agency capacity in planning, policy analysis, management, skills upgrading, management information systems, or the like.

Based on the above considerations, the OED evaluator assesses the operation's institutional development benefits, taking into consideration the costs incurred. OED assigns ID impact ratings of substantial, moderate, or negligible. Annex Box 3.6 provides an example of a case where OED's rating on institutional development impact differs from that of the ICR.

Rating Bank and borrower performance

OED assesses the way in which the Bank and the borrower have conducted their respective roles at each stage of the operation. The respective performances were found to be significant determinants of project outcome and sustainability in the 1994 Annual Review.⁶ The borrower, as "owner," and the Bank, as "lender" and/or "development advisor," have distinct roles and responsibilities at the identification, preparation, appraisal, implementation, and evaluation stages. Unless the borrower assumes primary responsibility for project preparation and execution, commitment to achieving project results is unlikely, and in most cases the results fall short of expectations.

The evaluator has to carefully distinguish Bank and borrower actions and their effects. For example, statements such as "project's performance was unsatisfactory because borrower implementation capacity was weak," do not automatically absolve the Bank from its responsibility in assessing such limited capacity at appraisal.

ANNEX Box 3.6: INSTITUTIONAL DEVELOPMENT IMPACT

Project: Mauritania Development Management Project (C1865-MAU)

ICR rating: Partial

OED rating: Negligible

OED's rationale for the rating:

The technical assistance project sought to support the government's implementation of the Economic and Financial Recovery Program by strengthening weak institutions and building administrative capacity for economic management and public service. Although some specific actions were carried out under the project, institutional and administrative improvements in the agencies concerned were limited or negligible. None of the project's objectives were fully achieved. In the words of the government, "the project has not made an impact on the day-to-day functioning of the Mauritanian administration, which is still inefficient and whose standard of service is not yet acceptable."

The evaluator also does not automatically determine that the Bank's performance in appraisal was faulty if a project fails. The causes of the failure may have been related to poor borrower performance, or exogenous or unpredictable events. The issue is whether a major part of the problem may have been lack of responsiveness by the borrower or lack of flexibility by the Bank in adjusting project objectives and activities during implementation

Country strategy

The assessment of Bank/borrower roles with respect to a particular operation is based in part on the Bank's country assistance strategy, grounded in the country's own development objectives as well as in the Bank's institutional priorities and its assessment of borrower capacities and performance. Changes in country strategy often have implications for the conduct of Bank-financed operations. Such changes get factored into the rating of Bank performance. The assessment of Bank and borrower performance is also directly linked to performance at the different stages of the project cycle.

Identification

Identification is a joint Bank and borrower responsibility. Although only governments can propose projects for financial assistance, identification can come from several sources, including Bank identification missions. To be a formal project, it must have the support of both the borrowing country and the Bank to ensure that its objectives are shared. OED determines that a project is appropriately identified when it conforms to a well-conceived country assistance strategy, that is, when it represents a potentially worthwhile contribution to priority development objectives; has the support of policy makers, affected communities, and potential beneficiaries within the country; and the Bank's assistance will be timely. Thus, the evaluator assesses the extent to which the government and potential beneficiaries participated in identifying the project for the loan or credit, the grounding of the work in economic and sector work (ESW), and the project's consistency with country strategy.

Preparation

Preparation begins when there is mutual agreement on project objectives. The idea for the project must be translated into a detailed proposal that considers all aspects of the project—technical, economic, financial, social, and institutional. The borrower is responsible for project preparation, with the Bank playing a supporting role. Questions that OED asks in assessing the adequacy of project preparation are: Were the terms of reference appropriately drawn? Did the borrower deploy staff with the right skills? Were sufficient time and adequate resources made available? Were potential beneficiaries involved? Was experience with similar projects drawn upon?

In examining the Bank's role in project preparation, the OED evaluator assesses whether project risks, as well as alternatives, were adequately considered. In addition, the OED evaluator considers whether the borrower required Bank assistance, and, if so, whether Bank assistance was delivered in an effective, relevant, and timely manner and if it was of satisfactory quality. In looking at borrower performance, the evaluator reviews the overall performance of the government and implementing agencies in taking account of economic, financial, technical, policy, and resource considerations in preparing the project.

Appraisal

Appraisal is the Bank's responsibility. The Bank should have provided an objective and rigorous assessment of the proposal to ensure that its objectives and modalities were relevant and appropriate, that it conformed with Bank standards, and that it was likely to be implemented effectively and efficiently.

In evaluating Bank appraisal performance, the OED evaluator assesses whether: (1) adequate investigations were carried out and relevant skills applied. The OED evaluator reviews the project documents to determine if they have adequately defined the development objectives for reaching the judgment to support the project with Bank funds; (2) if they laid out the means by which the objectives will be achieved; and (3) whether the implementation plan and the loan covenants properly reflected the essential conditions required to achieve such objectives. The OED evaluator also determines if reporting requirements were appropriate and the monitoring and evaluation systems suitable and relevant to operational needs.

In addition, the OED evaluator assesses the quality of the economic, financial, technical, institutional, social, and environmental analyses supporting the decision to finance the operation. This includes examining whether the Bank's loan processing requirements were adequately complied with.

Implementation and supervision

The OED evaluator distinguishes between implementation and supervision. The borrower is responsible for project implementation and for arranging any technical assistance needed. Typically, the borrower creates a special management unit or separate entity—especially for revenue earning activities—whose effectiveness in managing the project is a crucial aspect of borrower performance. The Bank is responsible for supervision, which includes the periodic assessment of implementation and its support requirements, and the facilitation or direct provision of needed support, such as technical assistance. Ideally, supervision relies on monitoring and evaluation (M&E) information provided by borrowers. The Bank's performance in adapting to changing circumstances—if necessary, full-fledged project restructuring—is an important consideration.

The evaluator assesses whether appropriate resources (for example, staff skills and resources) were mobilized to effectively carry out supervision duties. In assessing the Bank's responsibility in this area, the evaluator examines the Bank's responsiveness to changing conditions, quality of advice, and enforcement of legally binding conditions.

As part of the borrower's project implementation processes and of the Bank's supervision process, the OED evaluator assesses the quality of the evaluation mechanisms in place (for example, ongoing, mid-term, supervision reports) and what role, if any, these played, and could have played, in helping the project achieve its development objectives. The evaluator focuses, for example, on the extent to which performance indicators, such as those included in an M&E system, actually were used to measure project progress. The evaluator also examines the enforcement of borrower provision of M&E data agreed on at project approval.

In reviewing borrower performance, the evaluator focuses on the extent to which the government and implementing agencies supported project implementation, considering such factors as policies and maintenance of conditions at the macroeconomic level, and maintenance of conditions at the sectoral level; compliance with loan covenants and commitments; appointment of key staff with satisfactory training, experience, and skills to carry out the project; timely counterpart funding; administrative procedures for procurement, personnel, and other administrative matters that supported project implementation; effective use of available technical assistance; use of the participation of beneficiaries in implementing the project; and/or prevention of avoidable cost increases or realized cost savings.

ANNEX BOX 3.7: EXAMPLE OF BANK AND BORROWER RATING DOWNGRADES

Project: Jamaica Clarendon Alumina Production Project (L3062-JM)

ICR rating for Bank performance: Highly satisfactory

OED rating: Satisfactory

ICR rating for borrower performance: Highly satisfactory

OED rating: Satisfactory

OED's rationale for the rating:

The main objectives of this \$15 million project were to (1) sustain production and increase efficiency of the Clarendon Alumina plant; (2) improve the environmental conditions related to its operations; (3) help establish a joint venture company with the government and a private partner each having 50 percent of the shares; and (4) support sound sectoral policy. Project components included financing of equipment and spare parts to enhance plant performance, environmental control equipment, and construction of a mud lake waste disposal site. The project substantially achieved its objectives.

The highly satisfactory rating is used, however, to single out the small percentage of outstanding Bank and/or borrower performance cases with no shortcomings. In this case, however, the Clarendon Alumina Company had debt/equity ratios much higher than expected and made losses. On the Bank's side, projections of commodity prices were far too optimistic and the demand for Bank funds was overestimated, leading to a large cancellation.

Overall ratings for Bank and borrower performance

The OED evaluator must consider all the above factors in arriving at one aggregate rating each for Bank and borrower performance. Because such ratings are the result of expert assessments of many factors and components, there is no standardized weighting for them. In practice, however, OED seldom rates overall Bank performance satisfactory if it was deficient at either the appraisal or supervision stage. OED assigns ratings of either highly satisfactory, satisfactory, unsatisfactory, or highly unsatisfactory for Bank and borrower performance. Annex Box 3.7 provides an example of OED ratings of both Bank and borrower performance.

OED's procedures for rating quality of implementation completion reports

In rating the quality of ICRs, OED's evaluators keep three points in mind. First, the ideal implementation completion report is hardly attainable. While some ICRs will be better than others, all will have room for improvement. Second, it follows that merely because an ICR is deficient in part, it does not mean that it is unsatisfactory overall. OED reserves such ratings for the most egregious cases. Third, a major reason for rating ICRs is to improve the rigor and candor of regional self-evaluation. This is done not simply by assigning a rating, but through memoranda to the country directors on each ICR that highlight the ICRs' strengths as well as deficiencies, and provide a descriptive rationale for OED ratings. The draft evaluative memoranda to the board are shared and discussed with the country directors as part of the learning process and also so that disagreements can be aired and any errors corrected.

The policy guidance presented in BP13.55, Annex A (April 1995), calls for implementation completion reports to contain nine major sections and five annexes. Determining whether each of these segments is included in the ICR is the first step in OED's evaluation process. However, OED does not designate an ICR unsatisfactory solely because one of the required pieces is missing, nor does the fact that all the pieces are present make it satisfactory. What is most important is the content of the ICR.

From OED's perspective, an ICR is satisfactory if it includes sufficient reliable information to allow a judgment to be made on the major rating categories. OED is particularly concerned that the information presented in the ICR be able to support an evaluation of whether the project satisfactorily met its major relevant development objectives, and whether those achievements are sustainable. An ICR that fails to meet this test will generally be considered unsatisfactory. The information itself will typically be found in the ICR sections describing and evaluating project objectives, assessing the achievement of objectives, describing the implementation history, assessing sustainability, and rating outcome, as well as in the statistical tables described in BP13.55, Annex B.

The test is the sufficiency of information presented in the ICR. Even if the evaluator believes more or better information should have been collected and presented, that alone is not grounds for rating an ICR as unsatisfactory. In principle, there are nearly always additional data that could have been collected. For example, the ICR annexes required for compliance with BP13.55 include an aide-mémoire, cofinancier's contribution, and a map. While each of these is certainly desirable, none is critical for a satisfactory ICR. Similarly, some sections of the main text, such as those dealing with future operation of the project, may be missing. Again, by themselves, such weaknesses do not justify an unsatisfactory

ICR rating. Rather, these issues are brought to the attention of the country directors in efforts to improve the quality of future ICRs.

Also, an ICR is not rated as unsatisfactory only because its ratings differ from those assigned by OED evaluators. Such differences may be taken into account, however, in determining the ICR rating.

Analysis of the first cohort of 101 ICRs pointed out several areas that needed improvement. The first is the section on future operation plans. Too often, this was interpreted to refer to future projects planned. Instead, this section is to describe and assess the plans for sustaining the operation of the current project that is, with the last Bank disbursement, ending the implementation phase and beginning the operational phase. Second, this section of the ICR is also to describe the indicators that the borrower has agreed to use to monitor and evaluate the future operation of the project. Relatively few ICRs contained a description of future monitoring plans. A third area of needed improvement in the ICRs concerns sections on borrower involvement. While most ICRs did contain borrower's comments on the ICR and the borrower's own evaluation of the project, the response was often superficial. For example, many borrowers gave a "no comments" response or merely indicated they agreed with the ICR. Similarly, many borrower project evaluations were limited to descriptions of project implementation. Cofinancier comments on the ICRs were rare, even when their contributions to projects were large.

Participation and the rating process

Participatory evaluation is a new cornerstone of the Bank's evaluation paradigm. Participatory evaluation means involving borrowers and beneficiaries in the operation's monitoring and evaluation as well as in the rating process. Thus, borrowers report on the project at completion and comment on the ratings assigned by the Bank. They are provided a full opportunity to incorporate their views on OED's independent evaluation reports and ratings. Borrowers are further encouraged to involve beneficiaries in all aspects of the project evaluation.

Questions and answers on OED's rating system

OED disseminates its findings through a variety of documents such as this Annual Review of Evaluation Results, OED Précis, and evaluation studies. Additionally, OED has begun to present its findings directly to the regions through workshops. During these sessions, questions sometimes arise about project implementation completion ratings and OED's methodology. OED also recently conducted Groupware sessions, focusing on the ICR process, with 20 ICR authors and reviewers. This section summarizes the questions and concerns raised in these different fora and provides responses.

Q1. Why does the Bank need a rating system?

A1. Rating systems have accountability for performance and results as their central purpose. The reliable measurement of quality is a fundamental prerequisite of good management, and in the Bank, the rating system is central to both self-evaluation and independent evaluation of the success of its performance in aid intervention. The rating system provides structure and rigor to judgments made by staff. It helps judgments be more transparent and enables the same criteria to be applied to self-evaluation and OED's independent evaluation of project performance.

While based on individual projects, the Bank's rating system also allows tracking of the effectiveness of overall portfolio management. Portfolio management requires the weighing of development risks. Rating systems are essential for aggregating projects by region, sector, or country to look at past records of success or failure. They facilitate analysis of a large and complex portfolio over time and across projects for lessons learned. Organizational learning requires analyses of what makes projects succeed or fail. Rating systems also help identify the lessons so that they can be incorporated into the design of new projects, as appropriate, or so other corrective actions can be taken.

For more than 20 years, the World Bank has applied an extensive system of project performance ratings with many rating criteria and subcriteria to completed projects. It is significant that it is not alone in having such a rating system. Since 1990, many development organizations have followed the World Bank and introduced project completion rating systems as part of the management of their aid programs.⁷ In addition to the Bank, rating systems for project implementation completion reporting are being used, for example, by the Kreditanstalt für Wiederaufbau, Germany; the African Development Bank; the Asian Development Bank; the Overseas Development Administration, United Kingdom; the Gesellschaft für Technische Zusammenarbeit, Germany; and the Caisse Française de Développement, France.

Q2. How reliable are OED ratings? Are the ratings too subjective?

A2. Ratings attempt to simplify what is always a complex reality. For that reason, OED always includes a narrative evaluative memorandum with its project ratings, which explains the basis for the ratings and any differences in the OED ratings from the region's ratings. It is also important to note, however, that some rating criteria are more "objective" or more easily quantified than others. For example, the presence or absence of an economic rate of return, an aide-mémoire, or borrower's comments is relatively easy to discern. It is more difficult to determine a sustainability rating. The assessments are much more than checklist exercises, although they are based on a set of defined procedures for rating the performance and results of Bank lending operations. The Bank's rating methodology is a mix of qualitative and quantitative assessments based on extensive guidance and made by experienced project officers, and validated by experienced independent evaluation staff who review many project assessments in a given year.

OED is continuously engaged in improving the rating system and its application. For example, in FY96 OED conducted an empirical test of inter-rater reliability on its ratings. While reliability was generally found to be of an acceptable level, problems and issues were identified and discussed by staff and specific suggestions for improvement made. OED is currently taking steps to improve reliability further, such as further streamlining of its data recording information form and training staff.

Q3. How fine can OED be in its ratings given the state of the methodology? Why does OED second-guess the regions on such fine distinctions?

A3. OED believes it is better to be approximately right than precisely wrong. In other words, it is better to have "shades of gray" than black and white ratings. Shades of gray ratings can highlight important distinctions for feedback to regions. For example, in one recent ICR review, OED gave the project's outcome a marginally satisfactory rating, while the region had given it a rating of satisfactory. OED noted in its evaluative memorandum that although the project's physical objectives had been achieved, controlled low fertilizer prices had seriously

affected the financial viability of most of the enterprises. In another case, where OED downgraded the rating to satisfactory, the reason stated for OED's action was that the outcome of two of the major subprojects was still unknown and both subprojects had faced some implementation difficulties.

OED does not "penalize" the regions, however, for shades of gray distinctions. When reporting outcome ratings, OED does not count as differences in ratings those involving marginal differences. Moreover, for analytic and reporting purposes, such as in this Annual Review, it often uses a two-point scale where projects are either satisfactory or unsatisfactory in outcome. In an analysis of the first cohort of 101 ICRs sent to the board and reviewed by OED, OED reported that on this two-point scale, regional ratings of project outcome were broadly consistent with OED's ratings. In all but three cases, one where OED lowered the rating and two where OED upgraded the rating, OED and the regions agreed on the satisfactory/unsatisfactory outcome rating.

Q4. If a power plant is built under cost, shouldn't the project outcome always be considered satisfactory?

A4. OED judges project outcome in terms of relevance, efficacy, and efficiency. Relevance includes determining whether the operation was consistent with country and sector assistance strategies, whether its design was appropriate in terms of Bank policies, and whether service delivery is sustainable in light of institutional capacity, financial stability, and the like. In this case, Bank policy on utilities should be taken into account as well as the specific objectives set up for the project. Other factors, such as compliance with covenants, whether this is the first or the fourth operation in the sector, and the like, also should be considered.

Q5. We are in an inherently risky business; why give the public the misleading sense, by giving unsatisfactory outcome ratings, that there may be inefficiency or corruption present?

A5. Ratings generally make information about an organization's performance more accessible to those outside the organization. The Bank works to make clear to the public how seriously we take accountability and the pride we take in being the most demanding development agency in the world. That is why the Bank publishes the Annual Review of Evaluation Results.

In its study of rating systems in development banks, the Development Assistance Committee (DAC) is finding that reluctance to expose sensitive information to third parties exists particularly among organizations that are about to introduce rating systems or have recently done so. Development organizations that had already used rating systems for some time, however, reported few negative experiences in this respect. The study found that ratings provide a more solid base for reporting to external constituencies and that the general public was generally appreciative.

Q6. Why not offer training on how to do a good ICR?

A6. Extensive guidance is available on implementation completion reports (see OP/BP/GP 13.55). In addition, the Operations Policy Department is currently working with OED to identify examples of good practice ICRs and will include these examples as part of the guidance. OED recently conducted Groupware sessions with 20 of the primary authors and reviewers of ICRs. This was not a statistically valid sample, but a number of plausible themes emerged from the exercise. Among them was a call for training on producing a good ICR. As a result, OED is

discussing with the Learning and Leadership Center the idea of including a module on ICRs as part of another course.

Q7. What is the relationship between project outcome and Bank performance?

A7. Any discussion of Bank performance assessment must start with an understanding that the Bank faces different kinds of risk. The difference between performance and outcome ratings reflects the fact that some of these risks are under direct Bank control while others are not. In assessing performance, we must consider the risks that are acceptable to incur given that we are in the development business and that we face specific risk circumstances in different countries and different sectors. Obviously, the Bank's shareholders do not expect the Bank to avoid risk, but they fully expect that Bank performance will be such that Bank standards are observed and operational risks are managed so that satisfactory development outcomes are achieved. Equally, borrowers are far from indifferent to Bank performance. Given that Bank loans and IDA credits must be repaid, country relations are not helped by problematic portfolios related to poor Bank performance.

While the Bank carries joint responsibility with the borrower for project identification and full responsibility for appraisal, activities concerning project preparation and implementation are the primary responsibility of borrowers. Borrowers, in turn, rely on a variety of public, private, and voluntary agencies, and frequently on other development agencies and the willing participation of beneficiaries. Also, projects are not implemented in a vacuum. They are powerfully influenced by the implementation environment, that is, by the quality of country policies and institutions. Uncontrollable factors such as weather and civil strife also play a part, but they are not statistically as important as the other factors in the aggregate.

Quantitative analysis of the determinants of portfolio performance, reported in the 1994 Annual Review of Evaluation Results and confirmed in the 1995 Annual Review, found that borrower performance is the crucial determinant of project outcome, and Bank performance is the next most influential determinant of performance. Bank performance is judged by relating Bank actions against its own operational policies and good practice standards. Specific implementation circumstances also have to be taken into account.

Q8. What is the PIF?

A8. The PIF, or project information form, is the form OED uses to record its ratings and input them into a longitudinal database. The database enables aggregation and analyses of results like the ones in this report. The PIF is undergoing revisions for FY97 intended to streamline it. Bank staff can access key PIF ratings, including outcome, sustainability, and institutional development, through the Operations Policy Department's Operations Information System.

Q9. Where can I find OED's evaluative memoranda?

A9. OED's Evaluation Textbase (ETB) is available to Bank staff through the All-in-One information services and the Operations Information System. The ETB contains more than 4,200 entries and includes summaries of completion reports, audit reports, impact evaluation reports, evaluation studies, and OED's Précis and Lessons & Practices series. Starting with the 101 FY95 and FY96 ICRs, the ETB contains OED's evaluative memoranda on the projects. ETB has full search capability, and information can be sorted by sector, subsector, country, date of the memorandum, and the like.

Q10. What is the early experience with the new ICRs?

A10. Early experience with a first cohort of 101 ICRs finds the new process resulting in broadly satisfactory completion reports. Most give a good account of project histories, achievement of project objectives, and lessons learned. The major shortcomings were the minimal nature of borrower involvement and the lack of good forward-looking sections that summarize plans for the project's future operation.

Notes

1. See *Assessing Development Effectiveness: Evaluation in the World Bank and the International Finance Corporation*. Washington, DC: World Bank. May 1994.
2. Beginning in FY97, the audit ratio will decrease to 25 percent in order to enable OED to move ahead with new products and also to shorten the feedback loop by focusing more on the early stages of the program and project cycles.
3. The two ID ratings have been found to differ from one another in about 25 percent of the cases.
4. In recent years, there has been growing recognition that economic development must be environmentally sustainable; that is, economic growth and development must meet human needs without undermining the integrity of the ecosystems on which future development depend. There has also been a gradual realization that economic development must be socially sustainable as well. In other words, the development process must generate the social conditions, social institutions, attitudes, and values necessary to sustain development. Social development then is the mutually reinforcing changes in a society's organizations and institutions and in the attitudes and values that underpin them.
5. Capital stock covers four categories: natural resources, produced, human, and social. Social capital refers to the institutions and values that enable societies to function.

7. The Operations Review Unit of the Netherlands Directorate General for International Cooperation, in close cooperation with the Evaluation Department of the Overseas Development Administration of the United Kingdom, conducted a study of rating systems in project supervision and evaluation for the Expert Group on Aid Evaluation of the Development Assistance Committee.

Annex 4: Different approaches to long-term trend analysis

While the Annual Review strongly focuses on the results of the latest *evaluation year* (this year on the 1995 cohort), it is important to put these results into a longer-term perspective and to understand the underlying dynamics over time. Different approaches have been tried to establish this longer-term perspective. In any given evaluation year, project approval and closing years vary. Approval years span a significantly longer period than closing years (see Annex Table 1.2), from six to seven years for the bulk of projects covered; this translates into a lag between approval and evaluation of up to nine years or more. An evaluation cohort is thus a highly heterogeneous compilation of projects that have been subject to widely varying influences and policies during their preparation and implementation periods. Because of this heterogeneity, it is difficult to get a good reading of a longer-term trend of project results based on evaluation year cohorts.

A clearly superior approach is to establish a trend of project results based on *approval years*. The underlying rationale is that projects approved in the same year were governed by the same Bank policies and practices at the decisive moment of project preparation and appraisal, which have been found to be significant determinants of project outcome. At the same time, the time elapsed between the approval of a project and its closing or evaluation, which reflects the speed of project implementation, also influences project outcome. Projects with shorter implementation periods generally tend to be more successful than those drawn out over excessively long periods. This means that, in general, better performing projects are closed and evaluated first. Aggregate results for a whole annual evaluation cohort are, therefore, subject to a bias, which varies with the percentage of projects of a given approval year covered in a given evaluation year. The lower the coverage, the more "optimistic" the bias, as an "early" sample of projects of a given approval year tends to be heavily loaded with the more successful projects with relatively shorter implementation periods. The final evaluation result for all projects of a given approval year is obviously only fully known once all projects of that approval year have been closed and evaluated. However, the deviation of evaluation years with incomplete project coverage of a given approval year tends to become smaller over time as coverage expands. It is within a relatively narrow range once 60 percent of the approval year cohort is covered (see Annex Tables 4.1 and 4.2, and Annex Figure 4.1). Applying the 60 percent coverage rule to the 1995 evaluation cohort allows unbiased (or one with a relatively small bias) estimate outcomes only for projects approved up to 1986. This is obviously a long lag, and it is difficult to accept that over all these years, the main influence on a project's outcome would have been exerted at (or before) the time of approval. Hence, the closing year approach is viewed as an alternative with a shorter lag to "real time" developments.

Establishing a trend requires greater homogeneity than afforded in the evaluation year cohorts. Basing trend analysis on *closing years* plays down the importance of the factors at work at or before project approval and emphasizes the later years in the project cycle, when some of the current Bank policies were already in place and supervision, even at advanced stages of project implementation, would have afforded the Bank and the borrower an opportunity to apply some elements of these latest policies. This is particularly true for the increased supervision efforts that followed the 1991/92 report of the Portfolio Management Task Force. Moreover, for accountability purposes, many of the current managers did have an opportunity to influence project implementation and outcome in more recent years and can be, at least partly, associated with the outcome. Trend analysis based on closing year is not totally free of the problems affecting analysis based on approval year. It also takes several years for evaluation to cover a sufficiently high percentage of projects from any given closing year. To achieve close to 100 percent coverage, however, does not usually take more than two to three years, given the Bank's policy of requiring implementation completion reports within six months of project closing. Thus, in summary, the closing year approach to longer-term trend analysis is preferred. It is also the one documented in this annex and most often referred to in the text of Volume I, whenever multi-year periods are used for intertemporal comparisons.

Box Figures 2 and 3 in Chapter 1, Volume I, reveal three different phases for the outcome ratings, with a time lag of about six years between the approval and closing years. These phases are described and analyzed in Box Figure 3, which shows that outcome ratings by evaluation years suffer from too much "zig-zag noise" and do not reveal these phases as clearly as the other two figures.

ANNEX TABLE 4.2: PERFORMANCE OF EVALUATED OPERATIONS, 1967–86
APPROVAL YEARS

Approval year	Evaluated operations		Satisfactory outcome	
	Number	Share of approval operations (%)	% satisfactory	Adjusted % satisfactory ^a
1967	35	67	83	79
1968	69	85	84	82
1969	98	95	89	89
1970	120	97	82	82
1971	117	98	84	84
1972	141	99	84	84
1973	167	99	84	84
1974	180	98	72	72
1975	189	99	76	76
1976	211	92	75	75
1977	218	96	74	74
1978	243	95	64	64
1979	238	97	66	66
1980	254	95	69	69
1981	233	97	69	69
1982	253	99	62	62
1983	243	98	66	66
1984	187	90	66	64
1985	232	88	70	68
1986	152	66	63	59

Note: Percentage calculations exclude operations not rated.

a. For years less than 95 percent evaluated, adjustment is made using the bias estimate derived in Annex Table 4.1.
